

Design System Foundations

Tokens, components, layouts, and workflow patterns for Valtireo.

VERSION 1.0 / 2026

Design Principles

Valtireo is a dense operational product. The design system should help users scan, decide, approve, verify, and keep records moving.

Operational clarity

Every view should quickly reveal object, owner, status, date, and next action.

Role-aware screens

HR, compliance, ICT, finance, supervisors, employees, and leadership should see the right actions.

Audit-ready by default

Metadata and timelines should be visible without making the product feel like paperwork.

Dense, not cluttered

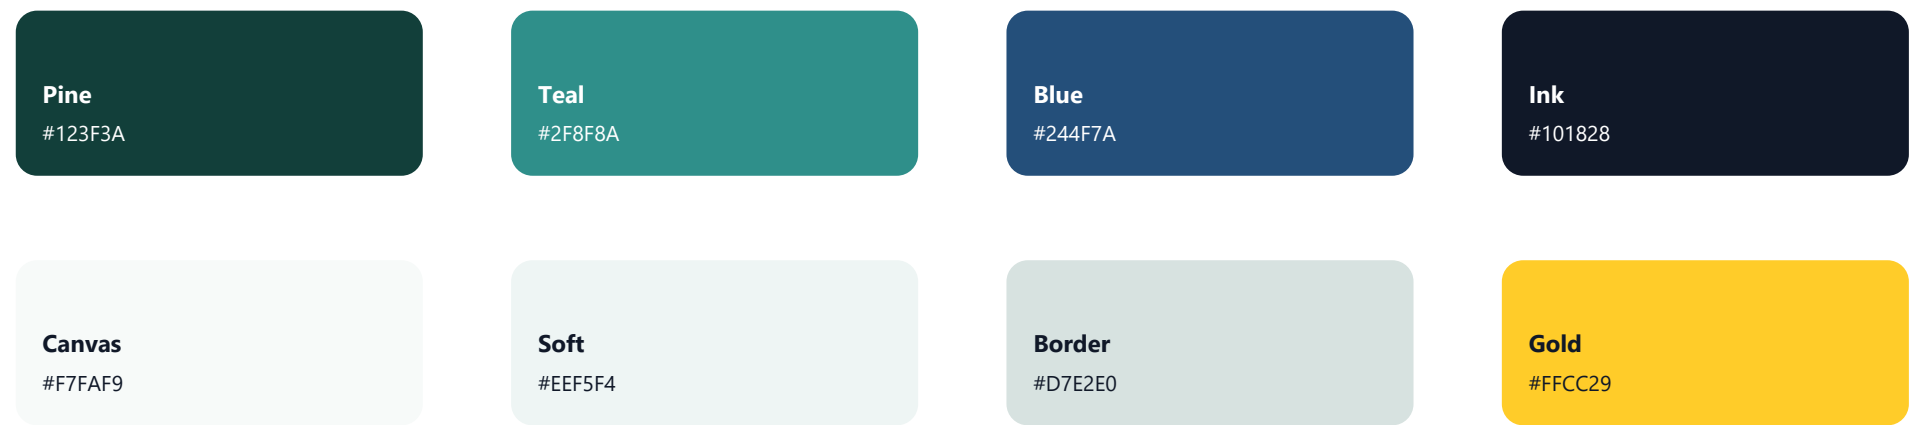

Use compact spacing, strong hierarchy, and predictable tables for daily administrative work.

Modular consistency

Modules should feel different in content, not in basic interaction rules.

Foundation Tokens

Tokens turn the Valtireo brand into reusable product decisions: color, type, spacing, radius, elevation, and status.

Implementation files: `output/design-system/valtireo-tokens.css` and `output/design-system/valtireo-tokens.json`.

Type Scale

Use readable, compact type. Dashboard and admin screens should not feel like marketing pages.

Valtireo

People operations

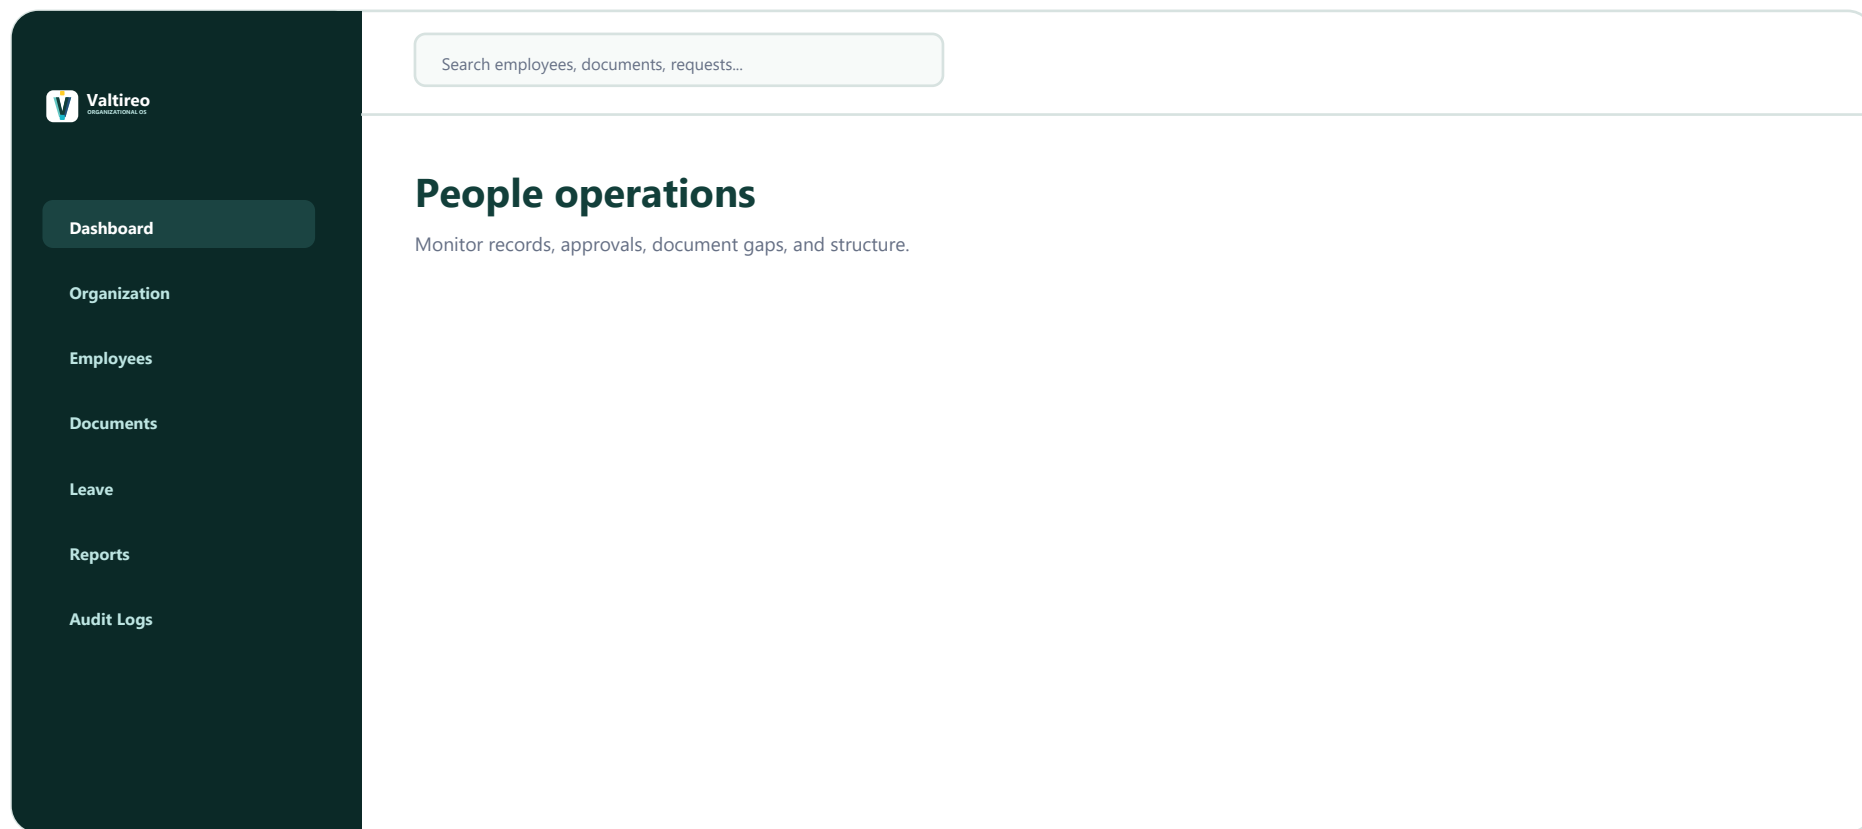

Employee documents awaiting review

Body text should support forms, tables, approval notes, activity logs, and operational descriptions without becoming too light or too decorative.

DISPLAY	30px / 36px / 800
PAGE TITLE	24px / 32px / 800
SECTION	18px / 26px / 750
BODY	14px / 22px / 400
LABEL	12px / 16px / 750

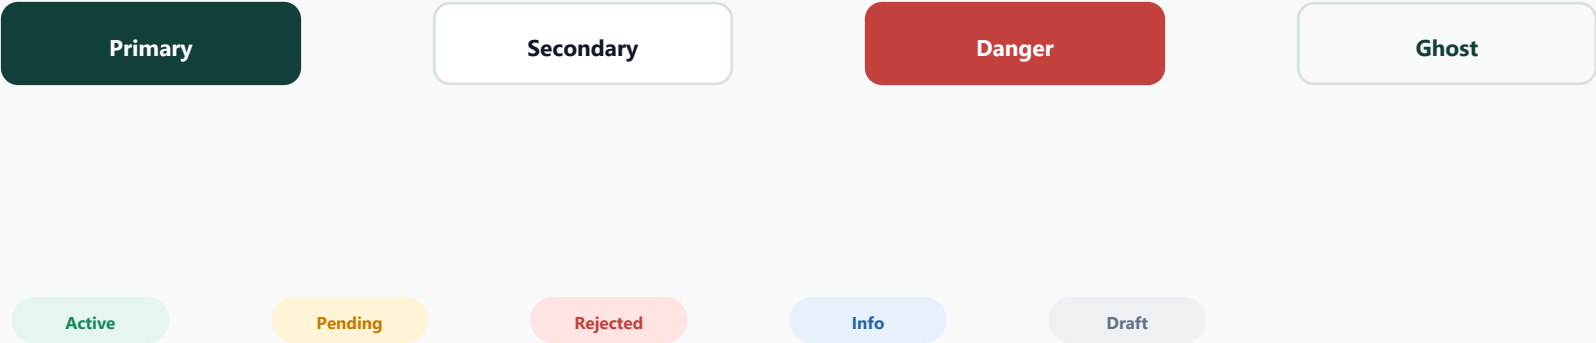

Application Shell

The shell gives every module a consistent operating environment: sidebar, topbar, page header, content region, and optional right panel.

Buttons and Status

Controls should be compact, clear, and action-specific. Status should be visible without becoming decorative.

Use verbs for actions: Approve, Reject, Request changes, Invite employee, Add document, Export. Avoid vague labels such as Continue or Okay when a workflow decision is being made.

Forms

Forms should group information by task and make required operational data easy to complete and review.

FIRST NAME

Mariam

LOCATION

Head Office

START DATE

2026-08-04

DEPARTMENT

Human Resources

EMPLOYMENT TYPE

Permanent

REPORTING MANAGER

Kelechi Nwosu

Guideline: separate long profile completion into clear sections: Identity, Employment, Contact, Emergency, Documents, Review.

Tables and Lists

Tables are first-class components in Valtireo. They should support scanning, filtering, bulk actions, and status comparison.

EMPLOYEE	DEPARTMENT	LOCATION	STATUS	PROFILE	ACTION
Mariam Okafor	Human Resources	Head Office	Active	Approved	View
Joy Udo	Operations	Lekki Field	Draft	Pending	Review
Fatima Yusuf	Compliance	Abuja Liaison	Pending	Missing docs	Open

Dashboards

Dashboards should be role-specific and exception-led. The goal is to show what needs attention, not decorate the homepage.

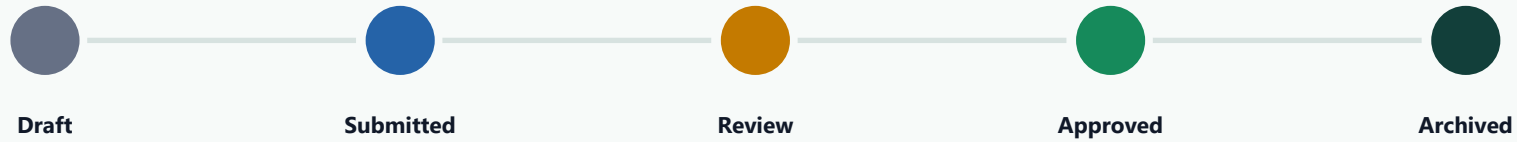

Dashboard rule

Prioritize tasks, exceptions, upcoming expiries, approvals, incomplete records, and audit-sensitive changes. Avoid marketing-style hero sections inside the product.

Workflow Patterns

Approvals and document states need consistent language, color, and interaction rules across modules.

Every approval screen should show requester, current approver, decision history, due date or age, attached documents, and the available decision actions.

Empty, Loading, and Error States

Operational products need useful states. Empty screens should help admins complete setup, not simply say nothing is here.

Empty

No employees have been added yet.

Invite employee

Loading

Loading employee records...

Skeleton rows

Error

Employee records could not be loaded.

Retry

Core Screen Patterns

The first frontend build should prioritize these screens before inventing module-specific layouts.

Employee list

Table, filters, bulk actions, export, saved views.

Employee profile

Identity header, tabs, completion, documents, activity.

Approval queue

Grouped requests, decision notes, history, requester.

Document registry

Types, requirements, uploads, expiry, approvals.

Setup settings

Organization, locations, departments, roles, modules.

Reports

Filters, summaries, export, schedule later.

Accessibility and Density

Valtireo should feel efficient without sacrificing readability, contrast, or predictable interaction.

-  Use visible focus states on every interactive element.
-  Do not rely on color alone for status; pair color with labels.
-  Keep table row height compact but readable.
-  Use labels above form inputs; avoid placeholder-only fields.
-  Keep destructive actions visually distinct and confirm major consequences.
-  Use plain operational language in validation and errors.

Implementation Handoff

This guide is the product-facing foundation. The next step is to convert it into frontend components and Storybook-style examples.

Build order

1. App shell
2. Buttons, badges, inputs
3. Tables and filters
4. Detail pages and tabs
5. Approval and document workflows
6. Dashboards and reports
